# RTG Service

RTG stands for Remote Traffic Generator. It's a service that enables telephone operators to successfully detect and prevent fraudulent access to its networks. The service is provided to the customer in the form of remote generated calls, which are scheduled via a Web Management Portal.

## How it works

Customer accesses the Portal using any of the currently available web browsers. A list of targets is added to the system via Excel file or manual input. Once the target list has been configured, the user is able to choose the starting and ending date, origin country and operators (calling cards, VoIP, etc.) that are going to be used for the bulk job. At the starting date selected the system starts generating calls from each of the operators selected for the bulk job to the targets stored, using a least-recently-used algorithm, which assures all the targets are called at least once.

## Hardware required

The customer is provided with as many RTG Receiving Devices (Target Frame in the diagram above) as needed. Each of these devices is fully configurable with the possibility of handling PSTN, GSM and ISDN PRI lines.

## Operation

The service is currently able to generate calls from the USA, UK, Spain, and other countries required by customers.
